Plastic + adhesive Analysis

~ Cyanoacrylate can withstand ~27.5 MPa on rigid materials such as PLA plastic

~ PLA plastic can withstand a yield stress of 25-60 MPa, depending on printing parameters
- let's assume with a 20% infill and 4 layer barrier, the strength ≈ 40 MPa

→ so, cyanoacrylate is likely to fail first; given a 700 N applied load to a $0.00542\ m^2$ surface area

$\sigma = 0.129$ MPa, well below the yield stress of cyanoacrylate and PLA

∴ Design is safe!
