Locking Hole Analysis

- This section focuses on the hole that has 700N applied to it
  - ↳ we should look at yield stress at the cross-section since max stress is likely to be there

700 N applied, however, more stress bias on the lower area

also distributed between the two

$$\frac{700}{2} = P \qquad \sigma_2 = \frac{350}{1.678 \cdot 10^{-5}} = 20.86\,MPa$$

$$\sigma_1 = \frac{350}{2.207 \cdot 10^{-5}} = 15.89\,MPa$$

Like we said previously, PLA plastic will yield above 25MPa, so we are in the clear; verify in ANSYS
